EXPERIMENT -12

End to end Communication at Transport Layer.

AIM:

To implement an echo-client server using Tcp/UDP socket and Implement a chat client-server using socket Programming.

a) Echo-client server using Tcp/UDP

A socket is an endpoint used for communication blw two device. In an echo program, the client sends a message to server and the server sends the same message back to client.

Procedure:

1) Create server program & client program.

2) Import the required socket library.

3) In server, create a socket & bind it to an IP address.

4) Make the server listen to the client request.

5) Start client and connect it

6) Enter message from client.

7) Send message to serve.

8) The server receives the message & send same message back.

9) The client receives & display the echoed message.

10) Close socket connection.

b) client server using socket Program.

1) Create server & client program using socket Programming.

2) start server & bind it to an Ip address

3) make server wait for client connection.

4) start client & connect it to server.

5) Enter message in client.

6) send message to server

7) The server receives and display message.

8) The server sends a reply back to client.

9) Continue reading & receiving message to perform a chat.

RESULT:

The end to end communication was successfully implemented using Tcp/ UDP sockets.
